How to Use Skin Seal – Topical Skin Adhesive

Skin Seal is a sterile, single-use topical adhesive for external wound closure. It provides a fast, effective, and painless method of closing minor cuts, surgical incisions, and lacerations.

Step-by-Step Application Guide

1. **Prepare the Wound**
    - Clean the wound thoroughly with sterile saline or antiseptic solution.
    - Ensure the area is completely **dry and free from blood, moisture, or ointments** before application.
2. **Assess Wound Depth**
    - **Superficial wounds:** proceed directly with Skin Seal.
    - **Deep wounds:** close internal layers with **absorbable sutures** before applying Skin Seal on the skin surface.
3. **Approximate the Wound Edges**
    - Gently **bring the wound edges together** using sterile forceps or gloved fingers.
    - Ensure proper alignment of skin edges for a smooth closure and better cosmetic result.
4. **Apply Skin Seal**
    - Hold the ampoule upright and **crush the inner glass vial** (if applicable) to activate.
    - Gently **apply a thin, even layer** of adhesive along the wound line.
    - Avoid pushing glue inside the wound—apply only on the skin surface.
5. **Allow to Polymerize**
    - Hold the wound edges together for **30–60 seconds** until the adhesive sets.
    - A **protective film** will form instantly, securing the wound.
6. **Post-Application Care**
    - Do **not apply ointments or dressings** over the adhesive film.
    - The film naturally sloughs off within **5–10 days** as the skin heals.
    - Advise the patient to **avoid scratching, soaking, or forcibly removing** the film.

Key Benefits

- Rapid, painless closure
- Excellent cosmetic outcome
- Barrier against microbial penetration
- Eliminates need for suture removal

Note:
Skin Seal is for **external use only**. For deep or high-tension wounds, combine with subcutaneous sutures as needed.
