How Skin Seal is Better than Sutures

1. **Non-invasive Closure**
   - Skin Seal closes wounds without puncturing skin tissue, unlike sutures that require needle penetration and can cause additional trauma.
2. **Reduced Risk of Infection**
   - Sutures leave multiple needle holes that may act as entry points for bacteria.
   - Skin Seal creates a protective antimicrobial barrier over the wound surface.
3. **Faster Application**
   - Skin Seal can be applied in seconds.
   - Suturing requires time, skill, and multiple steps.
4. **Less Pain & No Removal Needed**
   - Patients don't feel needle pricks or tightening from stitches.
   - No need for removal visits (sutures must be cut and removed later).
5. **Better Cosmetic Outcome**
   - Sutures can leave track marks or scarring.
   - Skin Seal forms a smooth film that supports natural healing and reduces scarring.
6. **Cost & Resource Efficiency**
   - Requires minimal instruments, no anesthesia, and shortens procedure time.
   - Reduces hospital stay and follow-up visits.
7. **Flexible & Comfortable**
   - Skin Seal allows natural skin movement and flexibility at the wound site.
   - Sutures can pull or tear with tension and restrict movement.
8. **Ideal for Minimally Invasive Surgery**
   - In laparoscopic and mesh fixation procedures, Skin Seal can be applied directly without the risks of suture gaping or knot-related complications.
